                                                                                                                                                                                                                                 The present sequence encodes a chimeric protein that contains a mammalian signal and anchor sequence, and a merozoite surface antigen-1 (MSA-1) carboxy terminal peptide. The C-terminal fragment of MSA-1 provides a more specific response than the complete MSA-1, and attachment of anchor and signal sequences improve the immunogenicity of the protein better than the use of an adjuvant. The chimeric protein, and expression vectors (analogues that express MSA-1 without either signal or anchor peptides), particularly in the form of recombinant vaccinia virus, are used in vaccines to prevent or treat malaria caused by Plasmodium falciparum. The vaccinia vector expresses the antigen fragment for many days, or even years, generating a long-lasting immune response (humoral and/or cell-mediated) against the merozoite form of the paragite. in humans or other actuals

The C-terminal fragment of MSA-1 provides a more specific response than the complete MSA-1, and attachment of the anchor sequence improve the immunogenicity of the protein better than the use of an adjuvant. The chimeric protein, and expression vectors (analogues that express MSA-1 without either signal or anchor peptides), particularly in the form of recombinant vaccinia virus, are used in vaccinia to prevent or treat malaria caused by Plasmodium falciparum. The vaccinia vector expresses the antigen fragment for many days, or even years, generating a long-lasting immune response (humoral and/or cell-mediated) against the merozoite form of the parasite, in humans or

                                                                                                                                                                                                             The present sequence encodes a chimeric protein that contains a mammal signal sequence, and a merozoite surface antigen-1 (MSA-1) carboxy terminal peptide. The C-terminal fragment of MSA-1 provides a more specific response than the complete MSA-1, and attachment of the signal sequence improve the immunogenicity of the protein better than the use of an adjuvant. The chimeric protein, and expression vectors (analogues that express MSA-1 without either signal or anchor peptides particularly in the form of recombinant vaccinia virus, are used in vaccinias vector expresses the antigen fragment for many days, or even years, generating a long-lasting immune response (humoral and/or cell-mediated) against the merozoite form of the parasite, in humans center the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the se

CC This novel, modified nucleic acid encodes the 42 kDa C-terminal CC (MSP-1-42), an important target for the development of a vaccine CC (MSP-1-42), an important target for the development of a vaccine CC against Plasmodium falciparum. The nucleic acid sequence has been CC modified compared to the native sequence of MSP-1-42 (see AAX56009) CC such that 306 nucleotide positions have been replaced to lower the CC AT content (from 76 to 49.7%) and to eliminate 10 mRNA instability CC motifs while maintaining the same protein amino acid sequence. CC These alterations allow MSP-1-42 to be expressed in mammalian cell CC culture and in transgenic mice. Native MSP-1-12 is known to be CC difficult to express in cell culture systems, mammalian cell CC culture systems or in transgenic animals. The invention allows CC expression of MSP-1-42 protein in the milk of transgenic animals, C and also provides a DNA vaccine comprising a vector containing the CC culture MSP-1-42 sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Modified malarial

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Q
This novel, modified nucleic acid encodes a 42 kDa C-terminal part (see AXY05832) of malaria merozoite surface protein MSP-1 (MSP-1-42), an important target for the development of a vaccine against Plasmodium falciparum. The nucleic acid sequence has been modified compared to the native sequence of MSP-1-42 (see AXX25587) such that 306 nucleotide positions have been replaced to lower the AT content (from 76 to 49.7%) and to eliminate 10 mRNA instability motifs while maintaining the same protein amino acid sequence. These alterations allow MSP-1-42 to be expressed in mammalian cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     culture and in transgenic mice. The invention provides modified recombinant nucleic acid sequences and methods for increasing the mRNA levels and protein expression of proteins that are difficult to express in cell culture systems, mammalian cell culture systems or in transgenic animals. The preferred difficult protein candidates for expression are those derived from lower organisms such as parasites, bacteria and viruses that have DNA coding sequences of high AT content or which have mRNA instability motifs or rare codons relative to the recombinant expression system to be used. The invention allows expression of MSP-1 protein in the milk of transgenic animals, and also provides a DNA vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine comprising a vaccine

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
This novel, modified nucleic acid encodes a 42 kDa C-terminal part (see AAY09374) of malaria merozoite surface protein MSP-1 (MSP-1-42), an important target for the development of a vaccine against Plasmodium falciparum. The nucleic acid sequence has been modified compared to the native sequence of MSP-1-42 (see AAX56009) such that the AT content has been reduced and 10 mRNA instability motifs eliminated while maintaining the protein amino acid sequence. In addition, a sequence encoding a 15-amino acid beta-casein signal peptide has been added to the 5' end of the sequence, and N262Q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CDS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and N181Q mutations have been introduced to eliminate N-glycosylation sites. These alterations allow MSP-1-42 to be expressed in the mammary gland (i.e. milk) of transgenic mice. The invention also provides a DNA vaccine comprising a vector containing an altered MSP-1-42 sequence.

               (MSP-1-42), an important target for the development of a vaccine against Plasmodium falciparum. The nucleic acid sequence has been modified compared to the native sequence of MSP-1-42 (see AAX25587) such that the AT content has been reduced and 10 mRNA instability motifs eliminated while maintaining the protein amino acid sequence. In addition, a sequence encoding a 15-amino acid beta-casein signal peptide has been added to the 5' end of the sequence, and N2620 and N1810 mutations have been introduced to eliminate N-glycosylation sites. These alterations allow MSP-1-42 to be expressed in the mammary gland (i.e. milk) of transgenic mice. The invention provides modified recombinant nucleic acid sequences and methods for increasing the methods are sequences and methods for increasing the methods and sequences and methods for increasing the methods and sequences and methods for increasing the methods are sequences and methods for increasing the methods for increasing the methods are sequences and methods for increasing the methods are sequences and methods for increasing the methods for increasing the methods for increasing the methods are sequences.

preferred difficult protein candidates for expression are those derived from lower organisms such as parasites, bacteria and viruses that have DNA coding sequences of high AT content or which have mRNA instability motifs or rare codons relative to the recombinant expression system to be used. The invention allows expression of MSP-1 in the milk of transgenic animals, and also provides a DNA vaccine comprising a vector containing the altered

                                                                                                                                                                                                                                          The present invention relates to non-natural variants of a C-terminal fragment of a Plasmodium merozoite surface protein-1 (MSP-1). The non-natural variants have reduced affinity for at least 1 antibody capable of blocking a second antibody that inhibits the proteolytic cleavage of Plasmodium MSP-1_4_2, and has the same affinity for at least cleavage of Plasmodium MSP-1_4_2, and has the same affinity for at least MSP-1_4_2, compared to natural MSP-1_1_9. The non-natural variants of the present invention are useful for immunising a mammal against malaria, and can be used to treat malaria. The present sequence is the MSP-142
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         4691

                                                                                                                                                                                                                                                                Q
                                                                                                                                                                                                                                                                                                                                                                                           망
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This nucleic acid encodes a 42 kDa C-terminal portion (see AAY09373) of malaria merozoite surface protein MSP-1 (i.e. MSP-1-42), an important target for the development of a vaccine against plasmodium falciparum. The 3' end of the sequence has been modified to include a 6xHis tag. The nucleic acid sequence has been modified (see AAX56008) according to a method of the invention in order to improve expression in mammalian host cells and in transgenic animals. In the modified coding sequence, 306 nucleotide positions have been replaced to lower the AT content (from 76 to 49.7%) and to eliminate 10 mRNA instability motifs. The encoded amino acid sequence is unaltered. In another modified sequence (see AAX56021), a signal peptide sequence has been added and two N-glycosylation sites eliminated. The invention allows expression of MSP-1-42 protein in the milk of transgenic animals, and also
                                                                                                                                                                                                                                                                                                             Matches

                                                                                                                                                          В
                                                                                                                                                                                     õ
                                                                                                                                                                                                                                                                    This nucleic acid encodes a 42 kDa C-terminal portion (see AAY05833) CC of malaria merozoite surface protein MSP-1 (i.e. MSP-1-42), an composition target for the development of a vaccine against important target for the development of a vaccine against composition of include a 6xHis tag. The nucleic acid sequence has been modified to include a 6xHis tag. The nucleic acid sequence has been modified to include a 6xHis tag. The nucleic acid sequence has been modified to improve expression in mammalian host cells and in the nucleic acid sequence. 306 nucleotide contains the form 76 to contain the form 76 to contain the form 76 to contain the form 76 to constitute and the eliminate 10 mRNA instability motifs. The encoded amino acid sequence is unaltered. In another modified sequence (see AAX25593), a signal peptide sequence has been added and two contain tucleic acid sequences and methods for increasing the mRNA levels and protein expression of proteins that are difficult to express in cell culture systems, mammalian cell culture systems candidates for expression are those derived from lower organisms such as parasites, bacteria and viruses that have DNA coding sequences of high AT content to which have mRNA instability motifs.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to non-natural variants of a C-terminal fragment of a Plasmodium merozoite surface protein-1 (MSP-1). The non-natural variants have reduced affinity for at least 1 antibody capable of blocking a second antibody that inhibits the proteolytic cleavage of Plasmodium MSP-1_4_2, and has the same affinity for at least one third antibody that inhibits the proteolytic cleavage of Plasmodium MSP-1_9. The non-natural variants of the present invention are useful for immunising a mammal against malaria, an cash be used to treat malaria. The present sequence is the MSP-133

```

The present sequence encodes a major merozoite surface protein-1 C-terminal fragment of 42kba (MSB1-42). This fragment is linked melittin signal peptide, and then expressed in a in a silkworm/baculovirus system. The protein is used to prepare a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         QY
                                    The sequence encodes a polypeptide which contains the unique sequence of the surface antigen of P. falciparum, but lacks the immunodominant repeat sequences which may allow the parasite to evade and decoy the immune system. The DNA for the stage-specific late schizoint merozoite antigen 31-1 in p31-1 (W08503725) was modified to delete the entire sequence coding for the repitope. The expression plasmid, 31-1 Repeated Delete, was introduced into E.coli K12 to produce the modified peptide. The transformant has been deposited in the Deutsche Sammlung von Microorganismen as E.coli K12 (9SG936cl) (p31-1 Repeat Delete). The peptide was used
                                                                                                                                                                                                                                                                                                                                                                                                                                                         SS;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to non-natural variants of a C-terminal fragment of a Plasmodium merozoite surface protein-1 (MSP-1). The non-natural variants have reduced affinity for at least 1 antibody capable of blocking a second antibody that inhibits the proteolytic cleavage of Plasmodium MSP-1_4_2, and has the same affinity for at least one third antibody that inhibits the proteolytic cleavage of Plasmodium MSP-1_4_2, and has the same affinity for at least one third antibody that inhibits the proteolytic cleavage of Plasmodium MSP-1_4_2, compared to natural MSP-1_19. The non-natural variants of the present invention are useful for immunising a mammal against malaria, and can be used to treat malaria. The present sequence is the MSP-119
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            surface

                                                                                                                                                                                                                                                                                                                                                             This is the nucleotide sequence encoding a chimeric protein comprising nucleotides encoding amino acids 1-32 of the Plasmodium vivax merozoite surface protein 1 (MSP1) linked to the nucleotide sequence encoding the 19 kD C-terminal fragment (p19) of MSP-1 from Plasmodium falciparum. p19 is the C-terminal fragment of the 42 kD MSP1 from Plasmodium species. The recombinant protein can be used for the production of anti-malarial vaccines, where the p19 fragment provides a high level of protective immunity since it includes epitopes not presented in the p42 fragment.
